

Operations users need real time visibility into inventory, production, supply, demand and transport information for fulfillment of contracts. The solution should be able to help users in better managing events, documentation, fees and transport.

ContraXcentral™ Fulfillment Management helps users manage planning, scheduling and actualization of any single or multiple commodities that are moved by vessel, barge or road and simplifies processes by managing events, documentation and fees. Schedulers can view available product quantities at any location, and match supply volume (including purchases, inventory and production) to market volume (including sales and consumption). **ContraXcentral™ Fulfillment Management** component can be used by operations to review and confirm physical position quantities, schedule physical shipments, record actual quantities, assign miscellaneous charges to specific shipments, capture the results of product quality tests for shipments, and track the status of claims.

ContraXcentral™ Fulfillment Management also captures detailed product quality data down to the individual shipment level allowing the price to be adjusted based on the actual qualities received or delivered. All documentation like notice of readiness, shipping instruction, bill of lading, letter of credit, etc. can be automated and generated by the system. **ContraXcentral™ Fulfillment Management** also keeps track of key movement event dates and workflows can be configured with the events.
